

Project Summary: Sales Data Analysis using SQL (SSMS)

This project focuses on analyzing a sales dataset using SQL Server Management Studio (SSMS) to extract meaningful business insights. I designed the database, created tables, and imported raw CSV data, followed by data cleaning and transformation to ensure accuracy.

Using SQL queries such as aggregations, GROUP BY, and window functions, I analyzed key metrics including total revenue, customer behavior, regional performance, and sales trends over time.

The analysis revealed that a small group of customers contributed significantly to revenue, certain regions consistently outperformed others, and sales followed seasonal patterns. Based on these insights, I proposed strategies such as targeting high-value customers, focusing on top-performing markets, and optimizing sales efforts during peak periods.

This project demonstrates my ability to perform end-to-end data analysis, transform raw data into actionable insights, and support data-driven decision-making.
